# SECUR TRACH

Secur-Trach is an innovative system to perform percutaneous tracheotomies easily in a completely safe way. Secur-Trach is a modified endotracheal tube that has a high intensity L.E.D. for transillumination in its anterior distal wall and a safety shovel that extends in its distal posterior wall. The use of Secur-Trach allows, thanks to the transillumination technique, the immediate finding of the right needle insertion point and the safe insertion of needle and dilators while the standard ventilation continues. The shovel protects the posterior tracheal wall from any damage that needles and dilators may cause. Furthermore it facilitates the tracheotomic cannula insertion and the removal of the endotracheal tube itself.

**1** L.E.D. FOR  
TRANSILLUMINATION  
For the easy finding  
of the right insertion point.

**2** SAFETY SHOVEL  
For the protection of the  
tracheal posterior wall.

The whole procedure is performed under STANDARD VENTILATION conditions without the need of re-positioning the endotracheal tube.

Secur-Trach is suitable for every percutaneous tracheotomy technique.

CE 0051
